ServiceNow Employee Import — Functional Solution Documentation

Project Documentation Format

1. Introduction

• Project Title: Import Data using Transform Maps (Spreadsheet)

• Team ID: SN-TRANSFORM-01 | Date: 30 September 2026 | Scope: ServiceNow employee spreadsheet import.

2. Project Overview

• Purpose: Provide a controlled, repeatable workflow for loading employee spreadsheet rows into ServiceNow, transforming them into Employee Test records, preventing duplicates, validating outcomes and reporting status.
• Features: Employee Import staging, five-field mapping, Transform Map execution, Employee ID coalescing, Transform History, reports and Employee Analytics Dashboard.

3. Architecture

• Source: HR / data-owner spreadsheet is uploaded through the ServiceNow Load Data interface.
• Platform: Employee Import staging → Sample Spreadsheet Import Transform Map → field mappings and validation → Employee Test target table.
• Data control: Employee ID is the coalesce match key; repeat imports update existing records and insert new records.
• Outputs: Transform History, department/location/employee-list reports and Employee Analytics Dashboard.

• Integration boundary: The solution uses standard ServiceNow Import Set and Transform Map capabilities; no external API or custom backend is required for the baseline project.

4. Setup Instructions

• Prerequisites: ServiceNow instance or application scope, administrator/data-owner access, Sample Spreadsheet.xlsx, Employee Import staging table, Employee Test target table and the approved Transform Map.
• Installation/configuration: Create the target fields, load the spreadsheet, create the Transform Map, map the five fields, enable coalesce on Employee ID, save reports and configure the dashboard.

5. Folder Structure

• Source artifacts: Sample Spreadsheet.xlsx and project brief.
• Configuration artifacts: Employee Import, Employee Test, Transform Map, field mappings and coalesce rule.
• Reporting artifacts: Transform History views, reports and Employee Analytics Dashboard.
• Documentation artifacts: requirements, data flow, architecture, planning and testing deliverables.

• Operational separation: Intake, transformation, validation and reporting are treated as separate review points so errors can be traced to the correct stage.

6. Running the Application

• Open the ServiceNow administrator interface.
• Load Data: select the employee spreadsheet and confirm the Employee Import staging rows.
• Transform: open Sample Spreadsheet Import, review field mappings, run the transform and inspect the result.
• Validate: check Employee Test records, Transform History, reports and dashboard.
• Repeat import: change an existing Employee ID or add a new ID, rerun the transform and verify update/insert behavior.

• No local frontend/backend start commands are required for the baseline; execution occurs in the configured ServiceNow instance.

7. API Documentation

• The baseline solution uses ServiceNow user-interface configuration rather than a custom REST API.
• System boundaries: Load Data and Transform Map actions create and transform Import Set rows; reports query Employee Test and Transform History.
• Any future integration should document authentication, request parameters, response mapping and error handling before implementation.

8. Authentication

• Access is controlled by ServiceNow roles and application permissions. Administrators configure imports and mappings; data owners review values and reports.
• Credentials are not stored in this document. Use the assigned instance roles and follow the project’s access policy.

9. User Interface

• Primary screens: Load Data, Employee Import staging list, Transform Map, Mapping Assist, Transform History, Employee Test list, reports and Employee Analytics Dashboard.
• The user experience is intentionally traceable: each action exposes the next review point and the resulting data state.

10. Testing

• UAT cases UAT-001 through UAT-006 cover intake, transform, repeat-import coalescing, validation, reports and dashboard.
• Functional/performance cases FT-01 through FT-04 and PT-01 through PT-03 cover headers, staging, mapping, transform, response time and report/dashboard load.
• Current baseline status: Not Run; execute in the configured ServiceNow instance and update the actual-result and defect fields.

11. Screenshots or Demo

• The project package includes project-specific data-flow and solution-architecture diagrams,

a planned burndown chart and testing matrices.

• A live demo URL was not provided; the solution is intended to run in the assigned

ServiceNow instance.

12. Known Issues

• UAT and performance test outcomes are pending execution.
• The baseline assumes the input spreadsheet contains the expected headers and Employee

ID values.
• Access to the ServiceNow instance and the final sample file is required for execution.
• No external API or automated deployment pipeline is included in the baseline scope.

13. Future Enhancements

• Add scheduled imports and source-file validation.
• Add duplicate/error exception queues and notifications.
• Extend the target table with additional HR attributes and reference-field validation.
• Add role-based dashboard views, audit exports and automated regression tests.
• Consider a secured inbound integration after the spreadsheet workflow is stable.
