Final Project Report

Import Data using Transform Maps (Spreadsheet)

Team ID: SN-TRANSFORM-01 | Date: 30 September 2026

1. INTRODUCTION

1.1 Project Overview

This project configures a ServiceNow employee spreadsheet import workflow. It stages source rows in Employee Import, transforms them into Employee Test, prevents duplicate records with Employee ID coalescing, validates the run through Transform History and communicates outcomes through reports and an Employee Analytics Dashboard.

1.2 Purpose

The purpose is to reduce manual HR data entry and make recurring employee imports traceable, repeatable and easier to validate.

2. IDEATION PHASE

2.1 Problem Statement

Administrators and HR/data owners need to import employee rows reliably from spreadsheets while handling updates, new employees, mapping errors and duplicate risk.

2.2 Empathy Map Canvas

The primary users are ServiceNow administrators and HR/data owners. Their jobs are to load, transform, verify and report employee data; their constraints include inconsistent spreadsheets, limited time and the need for controlled access.

2.3 Brainstorming

The selected concept combines Import Set staging, Transform Maps, Employee ID matching, validation history and reporting rather than relying on manual record entry or ad-hoc scripts.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Prepare spreadsheet → upload to Employee Import → review mapping → run Transform Map → inspect history → review Employee Test → consume reports/dashboard.

3.2 Solution Requirement

The solution must support the five required employee fields, repeat-import update/insert behavior, validation visibility, reports and dashboard outcomes.

3.3 Data Flow Diagram

The data flow is Source Spreadsheet → Employee Import staging → Transform Map and field mappings → Employee Test → Transform History and reporting.

3.4 Technology Stack

ServiceNow Load Data, Import Sets, Transform Maps, Mapping Assist, Employee Test table, Transform History, reports and Employee Analytics Dashboard.

4. PROJECT DESIGN

4.1 Problem Solution Fit

The solution fits the administrator's existing ServiceNow workflow and addresses the recurring problem of spreadsheet-based employee updates without requiring a separate data-entry channel.

4.2 Proposed Solution

Use a controlled staging-to-target workflow with explicit field mapping, Employee ID coalescing and visible outcomes. The design is reusable for larger files and additional attributes.

4.3 Solution Architecture

Source and administrator actions feed the ServiceNow platform; the platform stages, maps, transforms and validates; outputs are history, reports and dashboard views.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The backlog contains eight stories across two five-day sprints: Sprint 1 covers intake and target design (11 points); Sprint 2 covers transformation, validation and reporting (12 points). Total estimate is 23 points and planned velocity is 11.5 points per sprint.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

The testing package includes UAT cases for intake, transform, coalescing, validation, reports and dashboard, plus functional/performance cases for headers, staging, mapping, transform execution, repeat-import response time and report/dashboard loading. All baseline results are marked Not Run pending execution.

7. RESULTS

7.1 Output Screenshots

Project-specific diagrams and planning visuals were produced for the data flow, solution architecture and planned burndown. The final operational output should be captured from the assigned ServiceNow instance after UAT execution.

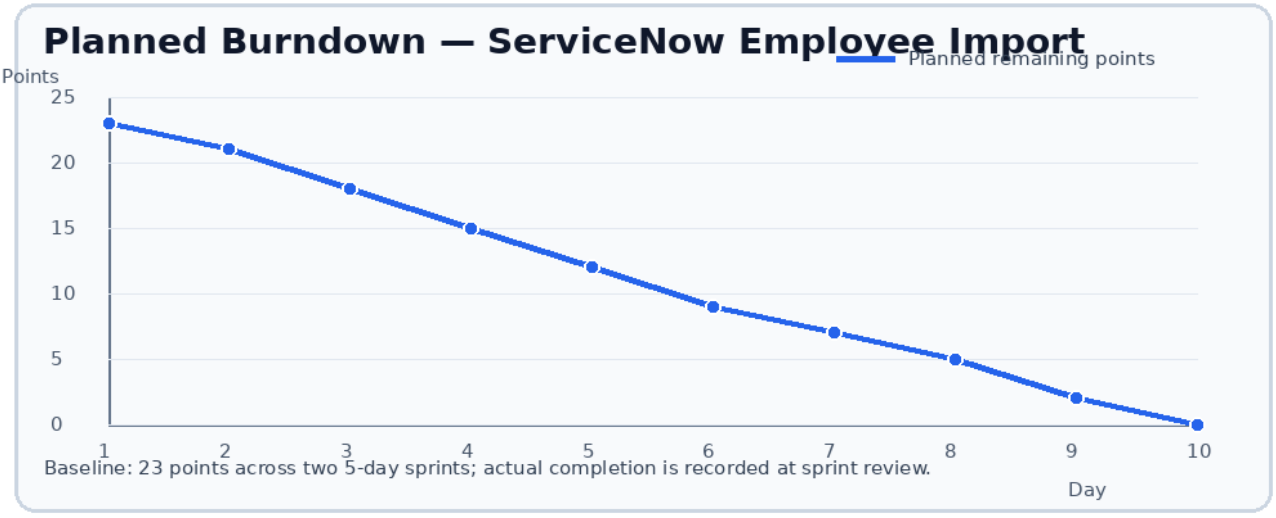

Figure 2. Planned story-point burndown.

8. ADVANTAGES & DISADVANTAGES

Advantages: traceable staging, predictable Employee ID matching, reduced manual entry, reusable mapping pattern and visible reporting. Disadvantages: depends on consistent source headers, requires ServiceNow access and still needs execution-time validation for malformed or incomplete rows.

9. CONCLUSION

The project provides a coherent ServiceNow solution for spreadsheet-based employee imports, connecting problem fit, requirements, data flow, architecture, planning and testing into one deliverable set.

10. FUTURE SCOPE

Future work can add scheduled imports, source validation, exception notifications, richer HR attributes, role-specific dashboards, audit exports and secured inbound integrations.

11. APPENDIX

Source Code: No custom source code is required for the baseline configuration. Dataset: Sample Spreadsheet.xlsx / approved employee spreadsheet. GitHub & Project Demo Link: Not provided; execution is performed in the assigned ServiceNow instance.
